

Granite, our 8 year old Chocolate labrador, has suffered from degenerative bone disease and arthritis in both front elbows.

Before stem cells, Granite walked bow legged and with a limp. He acted as though he was in great pain, and since he is a service dog he was unable to go on long walks with his owner.

He didn't play much, and would not even chase squirrels. The improvement was fantastic after he recieved his stem cell therapy. We now go out more and people remark how well he now walks.

You made Granite's life and my life a whole lot better! Thank You
